Description: THIS RESOURCE IS NO LONGER IN SERVICE, documented on July 15, 2013. Database covering a range of plant pathogenic oomycetes, fungi and bacteria primarily those under study at Virginia Bioinformatics Institute. The data comes from different sources and has genomes of 3 oomycetes pathogens: *Phytophthora sojae*, *Phytophthora ramorum* and *Hyaloperonospora arabidopsidis*. The genome sequences (95 MB for *P.sojae* and 65 MB for *P.ramorum*) were annotated with approximately 19,000 and approximately 16,000 gene models, respectively. Two different statistical methods were used to validate these gene models, Fickett's and a log-likelihood method. Functional annotation of the gene models is based on results from BlastX and InterProScan screens. From the InterProScan results, putative functions to 17,694 genes in *P.sojae* and 14,700 genes in *P.ramorum* could be assigned. An easy-to-use genome browser was created to view the genome sequence data, which opens to detailed annotation pages for each gene model. A community annotation interface is available for registered community members to add or edit annotations. There are approximately 1600 gene models for *P.sojae* and approximately 700 models for *P.ramorum* that have already been manually curated. A toolkit is provided as an additional resource for users to perform a variety of sequence analysis jobs.

Abbreviations: PAMGO_VMD, VMD

Synonyms: VBI Microbial Database, Virginia Bioinformatics Institute Microbial Database

Resource Type: production service resource, data or information resource, database, service resource, data analysis service, analysis service resource

Defining Citation: [PMID:16381891](#)

Keywords: microbial genome sequence, genome, genome sequence, genome model, gene, image, oomycete, fungus, bacteria, phytophthora sojae, phytophthora ramorum,

hyaloperonospora arabidopsidis, plant
