Description: THIS RESOURCE IS NO LONGER IN SERVICE. Documented on May 4th, 2023. Software to support registering brain images to the stereotaxic coordinate system of a brain atlas. It was specifically designed to work with the large scale brain mosaics. When data are uploaded to the CCDB, users may launch Jibber, a custom tool for defining correspondence points between the image and an atlas overlay. Jibber automatically downsamples the data, so that users can define the warping and scaling parameters with good interactive performance on the smaller copy. Once the warping transformation is computed, the original image and the transformation matrix are sent to a cluster of computers for warping. The current version of Jetsam is running on a 30 Sun V20 nodes and the execution time is roughly about 20 minutes per GB. The warped images are then automatically registered with an image web server that supports spatial queries based on stereotaxic coordinates. These servers generate optimized downsampled images, which can be displayed by standard online clients regardless of the size of the original image.

Abbreviations: Image Workflow

Resource Type: registration software, data processing software, software application, image analysis software, software resource

Keywords: brain, image

Availability: THIS RESOURCE IS NO LONGER IN SERVICE

Resource Name: Image Workflow

Resource ID: SCR_007017

Alternate IDs: nlx_156721

Record Creation Time: 20220129T080239+0000
