Description: Rattus norvegicus with name SD-Ngly1^{em1Ta/-} from RGD.

Species: Rattus norvegicus

Notes: The homozygous Ngly1 mutant rats are littermates of cross of heterozygotes Ngly1 mutant rats. The mutations created by CRISPR/Cas9 contained 2.6 kb deletions in exon 11 and exon 12 and a 3' flanking region of the Ngly1. Two single-guideRNA (sgRNA) sequences targeting sites upstream (5'-sgRNA; 5'-cagaggaattgtgatagtagcagg-3') and downstream (3'-sgRNA; 5'-ccagttattcataccatggtaaa-3') of the exon 11, exon 12 and a 3' flanking region of the rat Ngly1 genome, respectively. By the time of deposition, this strain was crossed twice to Crl:CD (SD). "Homozygous rats are obtained by crossing between heterozygous rats. Maintain the strain by crossing between heterozygous rats or by backcrossing to Crl:CD (SD) rats. Homozygous rats, both females and males, have no record of pregnancy and reproduction. They are more likely to be infertile." [National BioResource Project for the Rat in Japan](#)
