Proper Citation: WINGS (RRID:SCR_013997)

Description: A software application which assists scientists with designing computational experiments. WINGS is a semantic workflow system which incorporates semantic constraints about datasets and workflow components into its workflow representations. The workflow system has an open modular design and can be easily integrated with other existing workflow systems and execution frameworks to extend them with semantic reasoning capabilities. WINGS also allows users to express high-level descriptions of their analysis goals, and assists them by automatically and systematically generating possible workflows that are consistent with that request. In cases where privacy or off-line use are important, WINGS can submit workflows in a scripted format for execution in the local host. It uses Pegasus or OODT as the execution engine for large-scale distributed workflow execution.

Synonyms: Workflow Instance Generation and Specialization

Resource Type: software application, systems interoperability software, software resource, data management software

Keywords: semantic workflow system, software application, computational experiment, computational experiment design, data management software

Funding: NSF CCF-0725332;
