Proper Citation: multtest (RRID:SCR_001255)

Description: Software package for non-parametric bootstrap and permutation resampling-based multiple testing procedures (including empirical Bayes methods) for controlling the family-wise error rate (FWER), generalized family-wise error rate (gFWER), tail probability of the proportion of false positives (TPFP), and false discovery rate (FDR). Several choices of bootstrap-based null distribution are implemented (centered, centered and scaled, quantile-transformed). Single-step and step-wise methods are available. Tests based on a variety of t- and F-statistics (including t-statistics based on regression parameters from linear and survival models as well as those based on correlation parameters) are included. When probing hypotheses with t-statistics, users may also select a potentially faster null distribution which is multivariate normal with mean zero and variance covariance matrix derived from the vector influence function. Results are reported in terms of adjusted p-values, confidence regions and test statistic cutoffs. The procedures are directly applicable to identifying differentially expressed genes in DNA microarray experiments.

Abbreviations: multtest

Synonyms: multtest - Resampling-based multiple hypothesis testing

Resource Type: software resource

Keywords: differential expression, microarray, multiple comparison, bio.tools

Availability: Free, Available for download, Freely available

Resource Name: multtest

Resource ID: SCR_001255

Alternate IDs: biotools:multtest, OMICS_02085

Alternate URLs: <https://bio.tools/multtest>
