Description: Core provides vision researchers with in vivo imaging and functional analysis of visual system disease models, using instrumentation comparable to that used in clinical ophthalmology so that findings in animal models translate to human disease. Instrumentation includes Diagnosys electroretinography systems, Bioptigen SD optical coherence tomography, optokinetic tracking, Micron III and IV imaging systems with slit lamp and laser attachments, Zeiss operating microscopes with imaging, and specialized environmental housing including dark adaptation, dark rearing, and light damage. The core operates at two campus locations and also provides genotyping services for transgenic and mutant mouse and chick strains.
