Description: A data set and sister study to the Established Populations for Epidemiologic Study of the Elderly (EPESE). It complements the findings of the three other EPESE sites (East Boston, MA; New Haven, CT; and north-central North Carolina) and has common items and methods in many domains. The target population was all persons 65 years and older in two rural counties in east central Iowa: Iowa and Washington counties. In 1981 a census of older persons in the target area was conducted by the investigators, creating an ascertainment list having 99% of the persons identified in the previous year by the US Decennial Census. The baseline survey was conducted between December 1991 and August 1992. Overall, 3,673 persons, or 80% of the target population were interviewed: 65-69 (N = 986), 70-74 (N = 988), 75-79 (N = 815), 80-84 (N = 523), and 85+ (N = 361). The population is virtually entirely Caucasian. Subsequently, personal follow-up surveys were conducted 3, 6, and 10 years after the baseline survey. Telephone surveys were conducted 1, 2, 4, 5, and 7 years after the baseline survey. Data collected from respondents included information about demographics, major health conditions, health care utilization, hearing and vision, weight and height, elements of nutrition, sleep problems, depressive and anxiety symptoms, alcohol and tobacco use, cognitive performance and dementia screening, incontinence measures, life satisfaction index, social networks and support, worries, medication use, activities of daily living, dental problems, satisfaction with medical care, life events, brief economic status, automobile driving habits, multiple measures of physical and disability status, and blood pressure. At follow-up #6, there were a series of physical function performance tests, the so-called NIA-MacArthur Battery, and blood was drawn for biochemical tests and potentially other determinations. In addition, some datasets were linked to the EPESE dataset under appropriate restrictions, including Iowa state driving records and clinical diagnoses and medical care utilization from the Centers for Medicare and Medicaid Services. Data Availability: The dataset has been shared with several

**Abbreviations:** Iowa 65+ Rural Health Study

**Synonyms:** Iowa 65 Plus Rural Health Study, Iowa 65 and over Rural Health Study

**Resource Type:** biomaterial supply resource, material resource

**Keywords:** blood, mortality, hospitalization, chronic disease, late adult human, longitudinal, anthropometry, biomarker, survey, caucasian, demographics, health, health care, hearing, vision, weight, height, nutrition, sleep, depression, anxiety, alcohol use, tobacco use, cognition, dementia, incontinence, social, medication use, activity, dental, satisfaction, medical care, economic status, driving, physical, disability, blood pressure, interview

**Related Condition:** Aging

**Funding Agency:** NIA

**Availability:** Public

**Resource Name:** Iowa 65+ Rural Health Study

**Resource ID:** SCR_008937

**Alternate IDs:** nlx_151838
