Description: A biobank of repositories which works to obtain, store, manage and distribute large collections of human biological samples of phenotypes and diseases of marked interest for researchers. The biobank sample collection is made up of three extensive repositories. The Neurological Tissue Biobank is a nervous tissue repository (brain and spinal cord) created from donations from cadavers with or without neurological conditions. It helps facilitate research in neurological illnesses. The Tumour Biobank and Anatomical Pathologies Collections is a repository of tumorous tissue and samples from cancer patients. The Blood and Fluid Biobank is a repository which contains samples of metabolic, inflammatory bowel, hepatic, digestive and maternal and foetal diseases, among others. It houses a large range of samples of scientific interest, primarily DNA, serum and plasma.
